

Peak 11 Media

Automation & Passive-Income Map — Strategic Roadmap

An honest map of what already runs with little or no human effort, what to automate next (and what it costs), what the fully-passive end state looks like, and the lines that must never be crossed without a human in the loop. Updated June 2026.

0. The Thesis in One Paragraph

Peak 11 is engineered so the **AI does the labor and the human does the judgment**. Building sites, gathering content, deploying, generating leads, writing docs, updating the CRM, and fulfilling edits are all things Claude already does end-to-end at near-zero marginal cost. What stays human is narrow and deliberate: **talking to people, deciding, and approving anything that spends money, sends outreach, or goes public**. The roadmap below is about widening the automated lane without ever removing the human guardrail on the few irreversible steps — so the business drifts toward passive without drifting toward reckless.

The one number that makes this passive: flat effort, rising MRR.

Every part of Peak 11 except the Care Plan is linear — more revenue needs more work. The \$49/mo Care Plan is the only part that compounds, because edits are templated and AI-executed and monitoring is free. The whole automation program exists to keep management effort flat while the Care Plan base climbs. That gap is the passive income.

1. Current State — What Already Runs On Its Own

These are already effectively automated. Claude executes them with no manual steps from Nate; most are one instruction away from running. Honest grading below: "Automated" = Claude does it start-to-finish; "Assisted" = Claude does the work but a human triggers or approves.

Capability	Who/what does it	Grade	Notes
Site building	Claude writes custom HTML/CSS per lead from a template + the lead's real data	Automated	Demo built from public info; no human design step. Avalanche, Eagle, TSW, Bateman already built this way.
Content gathering	Claude scrapes business name, phone, hours, reviews, services, photos from public listings	Automated	Feeds the build. Owner confirms facts later, but the draft needs no human.
Deploys	gh api → GitHub Pages (blob → tree → commit → ref); free hosting, free HTTPS	Automated	System git is blocked; all pushes go through gh api. No servers, no monthly cost.
Lead gen + verification	Claude pulls SLC-area trades, verifies phone/email/site-gap, scores fit, writes to CSV	Automated	leads-qualified.csv, batch2 Provo/Ogden already generated and verified this way.
Doc generation	Claude builds branded PDFs/xlsx — SOPs, scripts, CRM tracker, this map	Automated	python-docx / reportlab / openpyxl. Zero human formatting.

Capability	Who/what does it	Grade	Notes
CRM updates	Claude edits pipeline.json + xlsx, regenerates the HTML board	Automated	Status, next action, deal \$ all updated by instruction.
Edit fulfillment	Care-Plan edit request → Claude makes change → redeploys via gh api	Automated	The core of the recurring model. Templated edits scale flat.

What still genuinely needs a human

This is the honest boundary. These are not automation gaps to close — several are deliberately human forever (see Guardrails).

- **Voice sales calls** — the warm/cold call to the owner. This is the closer's job and the single biggest human lever. AI preps it; a human makes it.
- **Relationship & trust** — small-biz-owner-to-small-biz-owner rapport, reading the room, handling objections live.
- **Approvals** — final yes on a demo before it's shown, on copy before it's sent, on a site before it goes live.
- **Spending money** — buying a domain, paying for any tool. Always a deliberate human-authorized step.
- **Sending outreach** — any email/DM/SMS that actually leaves the building is human-approved before send (drafted by AI, sent on approval).
- **Anything irreversible or public** — pointing DNS, publishing a live site, cancelling a subscription.

2. The Automation Roadmap — What To Add Next

Concrete, mostly-free automations in priority order. Each is rated **Cost** (Free / ~few \$) and **Lift** (Easy = an afternoon / Medium = a day or two / Heavier = a real build). Priority = impact on passive-ness per unit of effort.

#	Automation	What it does	Cost	Lift
1	Overnight lead replenishment	Scheduled routine refills the qualified-lead pool nightly: pull new SLC-area trades, verify phone/email, flag no-site businesses, score fit, append to the CSV — so the call list is never empty in the morning.	Free	Easy
2	Free uptime monitoring	UptimeRobot free tier (50 monitors, 5-min checks) on every live client URL; past 50 clients, a scheduled curl health-check that expects HTTP 200 and watches SSL expiry. Delivers a headline Care-Plan benefit at \$0.	Free	Easy
3	Auto demo-build pipeline	Top-scored lead → Claude auto-builds a preview from the lead's data → deploys to forge-demos subpath → writes the demo URL back to the CRM. A warm, personalized demo exists BEFORE the first call. (Build is auto; SHOWING it is human-approved.)	Free	Medium
4	CRM-driven follow-up reminders	Scheduled job reads pipeline.json, finds deals whose Next-Action date is due, and surfaces a daily 'who to follow up today' list (drafts the message too). Nothing sends itself — it just makes sure no warm lead goes cold.	Free	Easy

#	Automation	What it does	Cost	Lift
5	Templated edit → deploy flow	Standardize the Care-Plan edit path: intake captures the request in a fixed shape → Claude applies the templated change → redeploys via gh api → confirms back. Turns each edit into a near-identical, minutes-long task.	Free	Medium
6	Monthly client value-touch email	Once a month, AI drafts a short per-client email proving the plan is working (uptime %, edits done, a tip), pulled from CRM + monitor data. Drafted automatically; SENT only on approval.	Free*	Medium
7	Review-request automation	After go-live and at intervals, AI drafts a friendly 'mind leaving a Google review?' message tied to the client. Compounds the client's own SEO (more reviews → more calls → stickier Care Plan). Drafted auto; sent on approval.	Free*	Easy
8	Automated reporting	Scheduled roll-up of the whole business: new leads added, demos built, deals by stage, Care-Plan MRR, sites up/down. One branded dashboard/PDF so Nate sees the state in 30 seconds without asking.	Free	Medium

* **Free to draft and schedule.** The only possible cost is an email-sending service if volume outgrows a normal inbox — and these never auto-send anyway (see Guardrails), so the send step stays a cheap, approved, human action.

Sequencing — do them in this order

- **First (free + easy, fills the funnel):** #1 lead replenishment, #4 follow-up reminders, #2 uptime monitoring. These keep the pipeline full and the Care Plan benefit real with almost no effort.
- **Next (free + medium, raises close rate & retention):** #3 auto demo-build, #5 templated edit flow. These make every call warmer and every edit faster.
- **Then (free*, compounds retention & referrals):** #6 value-touch emails, #7 review requests, #8 reporting. These protect MRR and make growth visible.

How these run: scheduled, not magic.

Each automation is a scheduled Claude routine (an overnight/cron-style job) plus a free third-party where it helps (UptimeRobot). None require new paid infrastructure. The heavier-lift items aren't hard because of cost — they're 'medium' because they need a clean, repeatable shape (intake format, deploy helper, report template) defined once, then reused forever.

3. The Fully-Passive End State

When this is dialed in, the business runs as a loop: **leads flow in and get demoed automatically → a human closer takes warm calls → AI builds, delivers, and manages the site → Care-Plan MRR compounds → Nate oversees.** Here is each role mapped to AI, human, or tool.

Stage	Owner	How it runs
Lead generation	AI	Overnight routine refills + verifies the qualified-lead pool. Pipeline never runs dry.

Stage	Owner	How it runs
Demo creation	AI	Top leads auto-built into personalized previews, deployed free, URL written to CRM — ready before contact.
Outreach prep	AI	Per-lead call notes + a drafted opener/email prepared automatically for the closer.
The sales call	Human (closer)	Warm voice call to the owner using the AI-prepped demo + notes. The one irreplaceable human lever.
Approvals	Human	Yes/no on showing a demo, on copy, on go-live, on any spend. Fast, but always present.
Domain purchase	Human-authorized	The single paid step, deferred until the deal is closed and paid. Logged in CRM.
Build + go-live	AI	Custom site finalized, deployed to the client's repo, DNS/HTTPS wired, verified — all via gh api.
Care-Plan edits	AI	Edit request → templated change → redeploy → confirm. Minutes per edit, flat effort as clients grow.
Monitoring	Tool + AI	UptimeRobot / scheduled curl watches every site 24/7 at \$0; AI fixes the rare issue.
Retention touches	AI drafts / Human sends	Monthly value emails + review requests drafted by AI, sent on a quick approval.
Reporting	AI	Scheduled dashboard of leads, demos, pipeline, MRR, uptime — so oversight takes minutes.
Oversight / vision	Human (Nate)	Reads the report, approves the few human-gated steps, sets direction. Hours/week, not days.

Scaling stages — effort stays flat while MRR climbs.

0–50 clients: Claude runs everything, free monitoring covers it, Nate glances at quotes — a few hours/week, MRR up to ~\$2,450/mo. **50–100 clients:** swap monitoring to the scheduled curl check past UptimeRobot's free cap, keep edits AI-executed and batched — still near-passive, MRR toward \$4,900/mo. **100+ clients:** add a VA on the documented playbooks for intake and simple edits; effort per client keeps falling while MRR keeps climbing. That is the flywheel fully spun up: $100 \times \$49 = \$4,900/\text{mo}$ for a few hours of work a week.

4. Guardrails — What Must Never Auto-Fire

Automation widens the AI lane; these are the lines it never crosses without a human check. This is consistent with how Peak 11 already operates — default to action, but never on anything irreversible, public, or money-spending.

Action	Rule	Why
Sending outreach	Every email / DM / SMS that leaves the building is drafted by AI but SENT only after human approval.	A bad auto-send burns a lead, the brand, or deliverability — permanently. The cost of a human glance is seconds.
Spending money	No purchase auto-fires. Domains and any paid tool are bought as a deliberate, human-authorized step, logged in the CRM.	Spend is irreversible and trust-defining. Domains are deferred until a deal is closed and paid — never pre-bought on spec.

Action	Rule	Why
Publishing / going live	Pointing DNS, attaching a custom domain, taking a client site live = human-approved after QA on the preview.	A live site is public and represents a paying client. QA + owner sign-off come first, always.
Showing a demo	A demo can be auto-BUILT, but is shown/sent to a prospect only on approval.	Building is private and free; presenting is a brand-and-relationship moment a human owns.
Anything irreversible	Cancelling subscriptions, deleting repos, transferring domains, pausing a client's plan — never automatic.	No undo. A human decides anything that can't be cleanly reversed.
Client-facing claims	AI never invents facts about a client (awards, certs, hours). Owner-confirmed only before it goes public.	Wrong facts on a live site damage the client and Peak 11's credibility.

The principle behind all of it.

Automate the labor, gate the consequences. If a step is private, free, and reversible, let the AI run it unattended. If a step is public, costs money, or can't be undone, it gets a human check every single time — no exceptions, no 'just this once.' That one rule is what lets Peak 11 race toward passive without ever becoming reckless.

Peak 11 Media — internal strategy. The AI does the labor; the human does the judgment. Everything private, free, and reversible runs unattended; everything public, paid, or irreversible keeps a human in the loop. Build the roadmap top-down and management effort stays flat while Care-Plan MRR compounds.
