Lead Generation & Verification SOP

The repeatable, delegable process for finding and verifying small-business web-design leads in the Wasatch Front market. Updated June 2026.

1. Purpose & Core Principle

Peak 11 sells custom websites to local small businesses that lack a usable modern web presence. A lead is only worth a sales call if the business **genuinely needs a site** and is **active enough to pay**. The entire value of this process is in the verification — a padded list of unverified names burns the closer's time on businesses that already have a good website.

The Prime Rule: Accurate over fast.

A lead is not recorded until its website status has been personally verified — either the domain was loaded in a browser, or it was confirmed that no domain resolves. When uncertain, **err toward disqualify**. One bad call (pitching a business that already has a great site) costs more than ten leads we never recorded.

2. What a Qualified Lead Looks Like

Every qualified lead must clear all three gates:

- Active & reachable** — open for business, has recent reviews (Google/Yelp), and a phone or booking contact we can reach.
- In the target region** — Wasatch Front metro (Salt Lake, Davis, Weber, Utah counties and adjacent: Park City / Heber). Drop anything outside the named city set for the batch.
- Weak or no web presence** — falls into NONE / FACEBOOK_ONLY / DEAD / BAD (see the rubric). If it has a real, modern, working site (GOOD), it is disqualified.

Priority trades (owner-operated, money in hand, visual businesses): restaurants & cafes, barbers & salons & nails, auto repair / detailing / body / glass, home-trade contractors (concrete, masonry, fencing, drywall, HVAC, plumbing, electrical, painting, landscaping, handyman), pet grooming, bakeries, tailors / alterations, upholstery, shoe repair, tattoo, chiropractic / PT, specialty retail. These skew owner-run and under-built online.

3. Website Status Rubric

Classify every business into exactly one bucket. The first four are leads; GOOD is a disqualify.

Status	Meaning	Action
NONE	No website resolves anywhere. Only directory / Yelp / Google / Nextdoor listings.	DEAD Distings. Pitch "you have no website."
FACEBOOK_ONLY	Only presence is a Facebook/Instagram page, or a booking microsite (Squarespace, P, Bookyou, OnlySense, iA, Freshing, "no	DEAD Distings. Pitch "you have no website."
DEAD	A domain exists but is broken: 404, parked / for-sale lander, expired SSL, construction, Pitched by untrained down.	DEAD Distings. Pitch "you have no website."

BAD	A real site loads but is dated, thin, template / free-subdomain (Wix/Weebly/WordPress.com). It could be a real builder.	FACEBOOK_ONLY
GOOD	A real, modern, working, branded site.	DISQUALIFY — do not call. Log it so it is not re-sourced

Priority scoring (1–5): 5 = active, well-reviewed, NONE/DEAD (hottest). 4 = active NONE/FACEBOOK_ONLY/DEAD or strong BAD. 3 = BAD redesign or thinner social-only. 2 = real but low-signal (no published phone, sparse reviews). Sort the call sheet 5 → 1.

4. Where to Find Leads (Sources by Trade)

Mine these surfaces, then verify each candidate. Most are reachable by web search; Yelp listing pages often 403 a direct fetch, so drive them through the Chrome browser tools when needed.

General discovery

- Google Maps / Google Business — search "[trade] near [city]"; the listings without a "Website" button are prime NONE candidates.
- Yelp category pages per city (e.g. Yelp > Auto Repair > Midvale) — rich source of owner-run shops; harvest via browser.
- Nextdoor "recommendations," Birdeye, Manta, Porch, HomeAdvisor, BuildZoom — surface contractors and one-person LLCs.

Trade-specific

- **Home trades** (concrete, masonry, fencing, drywall, HVAC, plumbing, electrical, painting, landscaping, handyman): BuildZoom, Porch, HomeAdvisor, Procore directories, UVHBA / builder-association member lists, GreenPal (lawn care).
- **Barbers / salons / nails / esthetics:** Booksy, Vagaro, Square Appointments, GlossGenius, Fresha — booking-only listings are FACEBOOK_ONLY leads by definition.
- **Restaurants / cafes / bakeries:** Yelp, Google, and delivery aggregators (DoorDash/Slice/Zmenu). Note: aggregator menu pages are NOT an owned site.
- **Auto (repair/body/detail/glass/tint):** Yelp, BBB, CarTalk/Carwise, NAPA AutoCare locator.
- **Niche** (shoe repair, tailor, upholstery, watch/clock, tattoo, pet grooming): Yelp + Google; these skew old-school with no site.

Highest-yield angle for no-site businesses

Spanish-language / immigrant-owned businesses, food trucks, one-person home-service LLCs, and long-running old-school trades (cobblers, tailors, upholstery, diners) concentrate the NONE and FACEBOOK_ONLY pool. Mine these niches first when a saturated region runs dry.

5. The Verification Protocol (do this for EVERY lead)

This is the step that protects the closer's time. Never skip it.

- **Step 1 — Search the exact name + city.** Find the business and capture phone, address, owner name, review count, and any domain it claims.

- **Step 2 — If a domain is claimed, LOAD it.** Open the actual URL. Confirm it is THIS business's real, working, modern site before you ever classify it GOOD. Check: does it load? 404? parked/for-sale? expired SSL? template/free-subdomain? placeholder text? mobile-friendly?
- **Step 3 — If no domain appears, confirm none resolves.** Try the obvious exact-match domain (businessname.com). Only record NONE after confirming nothing real loads.
- **Step 4 — Classify** into one bucket using the rubric. When genuinely uncertain between BAD and GOOD, lean toward disqualify.
- **Step 5 — Record** all 11 fields. Never guess an email — only record an email that is actually published by the business.

6. Common-Name & Domain-Confusion Warning

The single biggest source of misclassification is assuming a domain belongs to the business when it does not. Real traps caught in past batches:

- **Out-of-state domain collisions** — allwaysfencing.com was a Texas company; phosaigonoodlehouse.com redirected to a Houston restaurant; drollingerfamilypainting.com belonged to an Alaska painter. The local UT businesses genuinely had NO site. Always confirm the domain is the same business in the same city.
- **Shared / similar names** — hebercityhandyman.com actually belonged to a different company (Main Street Maintenance), not Heber Valley Handyman. Match the domain to the specific business, not just the name.
- **Aggregator / auto-gen pages** — sills-cafe.shop, localsearch.com auto-pages, netwaiter, and delivery menus look like sites but are not owned. These are NONE or FACEBOOK_ONLY, not BAD.
- **Parked vs. real** — a domain that 301s to expireddomains.com or shows a GoDaddy/HugeDomains "for sale" lander is DEAD, not GOOD.

If you can't confirm a domain is theirs, treat it as if it isn't.

A domain that resolves to an unrelated or parked page does not disqualify the lead — it makes it a stronger DEAD/NONE lead. But never mark a business GOOD off a name match alone.

7. De-duplication & List Hygiene

- Cross-check every new lead against all prior master lists (leads-qualified.csv, leads-batch2, and each new batch) by normalized business name AND phone before recording.
- Within a batch, dedupe on name + phone so the same shop isn't logged twice.
- Keep a running **disqualified log** (businesses with GOOD sites) so they are never re-sourced in a future pass — this is how the pipeline stays efficient as it scales.
- Record the 11 standard columns exactly: Business Name, Category, City, Phone, Address, Website Status, Website URL, Email, Owner Name, Context, Priority.

8. Keeping the Pipeline Full

- **Work region by region.** Take one city cluster at a time and exhaust the priority trades before moving on.

- **Expect saturation to vary.** Davis/Weber and Utah County are heavily web-saturated — the true no-site pool is smaller there; SLC-valley niche trades and immigrant-owned businesses yield more. Don't pad to a target number; deliver the real qualified pool.
- **When a region runs dry,** pivot to the highest-yield niches (Section 4 callout) and adjacent cities rather than lowering the verification bar.
- **Batch size:** aim for 10–40 verified leads per region pass. Quality of verification, not row count, is the deliverable.
- **Hand-off to outreach:** sort the call sheet Priority 5→1; the closer starts at the top (active + NONE/DEAD) where the pitch is clearest.

9. Status → Pitch Cheat Sheet (for the closer)

Status	Opening pitch
NONE	"I noticed you don't have a website yet — your competitors do. I build custom ones for local businesses."
FACEBOOK_ONLY	"You've got a great following but no real website — customers can't find your hours/services without Facebook."
DEAD	"Heads up: your website is down/broken right now — it's a bad look for customers. I can rebuild it."
BAD	"Your current site looks dated and isn't mobile-friendly — a modern redesign would convert way more visitors."

Peak 11 Media — internal SOP. The whole process is delegable: anyone following Sections 4–6 produces a call-ready, verified lead sheet with zero wasted calls.
