

QR Menu Add-On

How to sell & build it · Peak 11 Media

A QR digital menu is the easiest upsell on every restaurant website deal. The diner scans a small code on the table tent and the full menu opens on their phone — clean, fast, branded. It costs us almost nothing to build and run, and it solves a real, expensive headache for the owner.

The pitch (what you say to the owner)

- **No more reprinting.** Change a price or 86 an item in seconds — no waiting on a printer, no boxes of outdated menus.
- **Instant updates.** Seasonal specials, holiday hours, sold-out items — live the moment you change them.
- **Commission-free.** Unlike DoorDash or third-party menu sites, this is THEIR menu on THEIR site — no 15-30% cut, no middleman owning their customer.
- **Looks premium.** A sharp mobile menu makes even a 40-year diner feel current without losing its character.
- **Just a table tent.** We print a small QR card for each table (or a counter sticker). Scan and it's there.
- **Cleaner & cheaper** than laminated menus — and customers now expect it.

Pricing

One-time build: \$150 – \$300

- **\$150** — small/simple menu; owner sends the list, we format it.
- **\$200–\$250** — typical diner: multiple sections, descriptions, allergen notes, matched to brand colors.
- **\$300** — large/multi-page menu, lots of items, photos, or two languages.

Optional maintenance: \$15 – \$25 / month

- We handle their menu/price updates so they never touch code. Most owners happily pay to skip the hassle — near-zero work for us, recurring revenue.
- Or sell it as 'first update free, then \$20 each' if they'd rather pay per change.

Margin: hosting is free (GitHub Pages / Netlify), no software to license, build is 1-2 hours. Close to pure profit, stacked on top of the website fee.

How we build it (our side)

- 1 Copy the reusable template: `templates/qr-menu/index.html`.
- 2 Edit ONLY the menu-data block at the bottom — brand name, est, phone, address, hours, accent color, then sections and items (name, price, description, tags for allergens/notes, optional 'Popular/Signature' badge).
- 3 Save as one self-contained .html file. No build step, no dependencies.
- 4 Deploy it static — GitHub Pages (gh api) or Netlify. Get the live URL.

- 5 Generate the QR with the Python 'qrcode' library pointing at that URL. Verify it decodes back to the exact URL.
- 6 Make a simple table-tent card: QR + 'Scan for our menu'. Hand the owner a print-ready PDF or order the cards.
- 7 To update later: edit the menu-data block, re-deploy. The QR never changes — same URL, new menu.

Why it's a fast upsell on every restaurant deal

Every restaurant website we build already has the menu content and brand. Turning that into a scannable table-tent menu is a 1-2 hour add we pitch in the same breath as the site: *'Want me to also set you up with a QR menu for the tables so you never reprint again? \$200, and I'll keep it updated for \$20 a month.'* It raises the deal size, deepens the relationship, and the monthly maintenance turns a one-time website client into recurring revenue.
