THE CALL QUOTA SYSTEM — a number to hit every day

Turning "go sell" into a finite, measurable, self-correcting daily target. June 2026.

1. Why a quota beats "just selling"

"Sell some websites this week" is a wish, not a plan. There is no way to know at 2pm whether you are winning or losing, so the brain treats every call as optional. A **dial quota** fixes that by converting the goal into one concrete action you fully control: pick up the phone N times today.

- **Finite.** "Make 36 dials" has an end. "Sell more" never does. A finite task gets started; an open-ended one gets avoided.
- **Measurable.** At any moment you know the score: dials done vs dials left. On-pace or behind, in one glance.
- **Self-correcting.** You control dials, not closes. Hit the dial number daily and the closes show up on their own — the math does the selling.
- **Kills call reluctance.** The target is the *activity*, not the outcome. A "no" still counts toward the number, so rejection stops feeling like failure — it's just one of the 36.

The one rule.

On a working day you do not decide whether to sell. You hit the dial number. That's the whole job. Everything downstream — connects, warm demos, closes, revenue — is a byproduct of the dial count.

2. The funnel (how a dial becomes money)

Every sale walks through four stages. Each stage only passes a fraction forward — that fraction is the conversion rate. The starting rates below are **research-grounded estimates for local-services cold calling**, used until Nate's own numbers replace them.

Stage	What it means	Rate to next
DIAL	You place a call.	→ 28% answer live
CONNECT	A real person picks up and talks.	→ 30% go warm
WARM	They agree to see a free sample demo.	→ 33% buy
CLOSE	They pay: \$400 build + \$49/mo.	—

3. The math — chaining the rates

Multiply the three rates to get closes per dial: $0.28 \times 0.30 \times 0.33 \approx 0.0277$. Flip it and you get the headline number:

≈ 36 dials = 1 sale

Worked example for 100 dials: 100 dials → 28 connects → 8.4 warm demos → 2.8 closes. So roughly every 36 dials buys one paying client at ~\$400 up front plus \$49/mo recurring that compounds month over month.

4. Your daily quota, per goal

Run the goal backwards through the funnel: revenue → closes → warm → connects → dials → dials/day.

Two live scenarios:

SPRINT		ONGOING	
Revenue goal	\$2,800 in 10 days	Revenue goal	\$5,000 in 30 days
Closes needed	7 (× \$400 build)	Closes needed	13 (× \$400 build)
Warm demos needed	22	Warm demos needed	40
Connects needed	71	Connects needed	132
Total dials	253	Total dials	469
DIALS PER DAY	26	DIALS PER DAY	16
Recurring added	+\$343/mo (MRR)	Recurring added	+\$637/mo (MRR)

Bottom line: hit 26 dials a day for the \$2,800 / 10-day sprint, or 16 dials a day for the ongoing \$5k/month.

That is the entire daily job. 26 dials is roughly 1.5–2 focused hours on the phone. Do that and the \$2,800 is not a hope — it's arithmetic. Miss a day and the tracker simply spreads the shortfall across the days left.

5. Replace the estimates with reality (the 50-call rule)

The rates above are **starting estimates, not facts about Nate**. His voice, his list, and his demo will land differently than the benchmark. So the system learns:

- Every day, log the four numbers: dials, connects, warm demos, closes. (Tap them in the dashboard, or just tell Claude — he writes them into the record.)
- The dashboard computes Nate's **actual** rates and shows them side-by-side against the estimates, with the gap for each stage.
- Until ~50 real dials are in, it blends estimate and actual (weighted by call volume) so a couple of lucky or unlucky calls don't whipsaw the quota.
- After ~50 real calls it stops trusting the estimates and drives the **true quota** entirely off Nate's own numbers — which usually means fewer dials per close as the pitch tightens.

The 50-call rule.

Do not argue with the estimate before 50 real calls — just feed it data. After 50, the estimate is retired and the quota is recomputed from what actually happened on Nate's phone. The number gets more honest, and usually smaller, the more he calls.

6. How this plugs into the rest of Peak 11

The daily call tracker is the front door of the pipeline. Each logged call flows downstream:

- **Live dashboard** — operation-50k/quota/index.html: today's dial target, progress ring, funnel, goal calculator, and on-pace light. Open it on the phone while calling.
- **CRM pipeline** — operation-50k/Peak11-CRM-Tracker.xlsx: a 'warm' on the tracker becomes a row in the CRM (status Interested → Building → Sent → Won). The call log is the top of the funnel; the CRM is the deal flow it feeds.
- **Sales scripts** — the script raises the connect→warm rate; the demo raises warm→close. Improving either rate lowers the daily dial quota.

Today's one job: open the dashboard, read the dial number, hit it. The pipeline takes care of the rest.
