

Quota Dashboard — Note

There is a **live Daily Call Quota & Conversion Tracker** dashboard (`operation-50k/quota/index.html`). It's an interactive web page, not a document, so it lives in the project — this note explains what it does.

What it does

- **Today panel** — tap +/- to log dials, connects, warm leads, and closes; a ring shows progress to today's dial goal.
- **The funnel** — editable conversion assumptions (start: 28% dial→connect, 30% connect→warm, 33% warm→close $\approx$ **36 dials per sale**).
- **Goal calculator** — reverse-engineers the daily dial quota for a target (e.g. **\$2,800 in 10 days** or **\$5,000/month**). Avg deal = \$400 build (founding rate) + \$49/mo.
- **Your actual numbers** — once ~50 real calls are logged it stops trusting the estimates and drives the quota off Nate's real rates, weighted by call volume.

How it's used

Tell Claude "log my calls" and report the numbers — Claude writes them into the dashboard's data store so the quota self-corrects from reality. The daily call log feeds the Peak 11 CRM pipeline.

The companion **Quota System** playbook (in Playbooks_and_SOPs) explains the full system in detail.
